Filing Date	:NA	

(57) Abstract :

The present project relates to a Smart Parking System designed to reduce parking congestion and improve space utilization in urban areas. The system provides an automated solution that enables users to check real-time parking availability and reserve slots through a web-based application. It integrates an Arduino microcontroller, ultrasonic sensors for slot detection, an RTC module for time tracking, and a centralized database for efficient parking management. During operation, ultrasonic sensors detect the availability of parking slots, while users can book a slot and receive a QR code for secure entry and exit authentication. The system records entry and exit times, calculates parking duration, and generates the corresponding fee automatically. This approach minimizes manual intervention, reduces waiting time, and enhances user convenience. The proposed system is cost-effective, scalable, and easy to deploy in environments such as malls, airports, and public parking areas. By integrating automation and real-time monitoring, the system improves parking management and supports smart city development
